# ENGINE

The following chart is provided to help in diagnosing the probable source of troubles. It should be used as a guideline. Some causes or corrections may not apply to a specific model.

| SYMPTOM         | ENGINE BACKFIRES.                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                     |
| Test/Inspection | 1. Check spark plugs.                                                                                           |
|                 | a. Carbon accumulation caused by defective spark plug(s).<br>Clean carbon accumulation and replace spark plugs. |
|                 | 2. Check ignition timing.                                                                                       |
|                 | a. Timing is too advanced.<br>Set timing according to specifications (refer to TECHNICAL DATA 10).              |
|                 | 3. Check carburetor.                                                                                            |
|                 | a. Fuel passages obstruted.<br>Clean carburetor and install new filter(s).                                      |
|                 | b. Fuel level too low.<br>Adjust float level according to specifications.                                       |
|                 | 4. Check cooling system.                                                                                        |
|                 | a. Loose fan belt.<br>Adjust or replace fan belt (refer to TECHNICAL DATA 10).                                  |
|                 | b. Low antifreeze level.<br>Adjust antifreeze level. Then check clamps or hoses.                                |
|                 | c. Defective tank cap.<br><i>Replace cap.</i>                                                                   |
|                 | d. Air in system.<br>Bleed system.                                                                              |

| SYMPTOM         | ENGINE SUDDENLY TURNS OFF AT HIGH RPM AND/OR WITH LIGHT LOAD. |
|-----------------|---------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                   |
| Test/Inspection | 1. Check that all 3 ground wires are well connected.          |

Subsection 02 (ENGINE)

| SYMPTOM         | ENGINE SUDDENLY TURNS OFF.                                                                                                                                                                                                                                                                       |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                                                                                                                                      |
| Test/Inspection | 1. Perform engine leak test. Refer to ENGINE LEAK VERIFICATION FLOW CHART.<br>Check possible piston seizure.                                                                                                                                                                                     |
|                 | a. Damaged gasket and/or seal.<br><i>Replace defective parts.</i>                                                                                                                                                                                                                                |
|                 | 2. "Four-corner" seizure of piston(s).                                                                                                                                                                                                                                                           |
|                 | a. Accelerating too fast when engine is cold. Piston expands faster than cylinder. <i>Replace piston(s). Ask driver to refer to warm-up procedure in</i> Operator's Guide.                                                                                                                       |
|                 | 3. Piston(s) seizure on exhaust side (color on piston dome is correct).                                                                                                                                                                                                                          |
|                 | a. Kinked fuel tank vent tube.<br><i>Relocate fuel tank vent tube.</i>                                                                                                                                                                                                                           |
|                 | b. Leaks at fuel line connections or damaged fuel lines.<br><i>Replace defective lines.</i>                                                                                                                                                                                                      |
|                 | <ul> <li>c. Fuel does not flow through carburetor(s) (foreign particles in needle area and/or varnish formation in carburetor(s)).</li> <li>Clean carburetor(s) and install new filter(s).</li> </ul>                                                                                            |
|                 | d. Spark plug heat range is too warm.<br>Install spark plugs with appropriate heat range (refer to TECHNICAL DATA 10).                                                                                                                                                                           |
|                 | e. Improper ignition timing.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                                                                                                                                                                 |
|                 | f. Restriction in exhaust system. <i>Replace.</i>                                                                                                                                                                                                                                                |
|                 | g. Compression ratio is too high.<br>Install genuine parts.                                                                                                                                                                                                                                      |
|                 | h. Carburetor calibration is too lean.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                                                                                                                                                       |
|                 | i. Improper rotary valve timing or improper valve.<br>Adjust according to specifications (refer to TECHNICAL DATA 10) and/or install<br>Bombardier's recommended rotary valve.                                                                                                                   |
|                 | j. Poor quality oil.<br>Use BOMBARDIER-ROTAX oil.                                                                                                                                                                                                                                                |
|                 | k. Leaks at air intake silencer.<br>Replace air intake silencer grommets.                                                                                                                                                                                                                        |
|                 | 4. Melted and/or perforated piston dome; melted section at ring end gap.                                                                                                                                                                                                                         |
|                 | a. When piston reaches TDC, mixture is ignited by heated areas in combustion chamber<br>This situation is due to an incomplete combustion of a poor quality oil.<br><i>Clean residue accumulation in combustion chamber and replace piston(s). Use</i><br><i>BOMBARDIER-ROTAX injection oil.</i> |
|                 | b. Spark plug heat range is too high.<br>Install recommended spark plugs (refer to TECHNICAL DATA 10).                                                                                                                                                                                           |
|                 | c. Ignition timing is too advanced.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                                                                                                                                                          |
|                 | d. Inadequate fuel quality.<br>Use appropriate fuel.                                                                                                                                                                                                                                             |
|                 | e. Carburetion is too lean.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                                                                                                                                                                  |

| 5. \$ | Seized piston all around the circumference (dry surface).                                                                                                                                                                                                                                                                                            |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ć     | <ul> <li>a. Lack of oil, damaged oil line or defective injection pump.<br/>Replace defective part(s).</li> </ul>                                                                                                                                                                                                                                     |
| 6. (  | Grooves on intake side of piston only.                                                                                                                                                                                                                                                                                                               |
| ć     | a. Oil film eliminated by water (snow infiltration in engine).<br>Replace piston(s) and check if intake system leaks.                                                                                                                                                                                                                                |
| 7. #### Section 03 TROUBLESHOOTING Subsection 02 (ENGINE)

| SYMPTOM         | ENGINE DETONATION AT MAXIMUM RPM.                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                    |
| Test/Inspection | 1. Check which type of fuel is used.                                                                                           |
|                 | a. Octane number is too low and/or alcohol level is too high.<br>Use recommended fuel type.                                    |
|                 | 2. Check spark plug type.                                                                                                      |
|                 | a. Improper spark plug heat range.<br>Install recommended spark plugs (refer to TECHNICAL DATA 10).                            |
|                 | 3. Check exhaust system.                                                                                                       |
|                 | a. Too much restriction.<br><i>Replace.</i>                                                                                    |
|                 | 4. Check ignition timing.                                                                                                      |
|                 | a. Timing is too advanced.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                 |
|                 | 5. Check carburetion.                                                                                                          |
|                 | a. Fouled and/or improper carburetor components.<br>Clean or replace according to specifications (refer to TECHNICAL DATA 10). |
|                 | 6. Check compression ratio and combustion chamber volume.                                                                      |
|                 | a. Compression ratio is too high.<br>Install genuine parts.                                                                    |

Subsection 02 (ENGINE)

| SYMPTOM         | ENGINE TURNS OVER BUT FAILS TO START.                                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                                                                                                  |
| Test/Inspection | 1. Check switches.                                                                                                                                                                                                                                           |
|                 | a. Ignition switch, emergency cut-out switch or tether switch is in the OFF position<br>Place all switches in the RUN or ON position. If it still does not work, connect<br>DESS switch BK/GN and BK/WH wires together (harness side).                       |
|                 | 2. Check fuel valve.                                                                                                                                                                                                                                         |
|                 | a. fully open fuel valve.                                                                                                                                                                                                                                    |
|                 | 3. Check fuel level.                                                                                                                                                                                                                                         |
|                 | a. Mixture not rich enough to start cold engine.<br>Check fuel tank level and use primer.                                                                                                                                                                    |
|                 | 4. Check spark plug.                                                                                                                                                                                                                                         |
|                 | a. Defective spark plug (no spark).<br><i>Replace spark plugs.</i>                                                                                                                                                                                           |
|                 | 5. Check amount of fuel on spark plug.                                                                                                                                                                                                                       |
|                 | a. Flooded engine (spark plug wet when removed).<br>Do not overprime or overchoke. Remove wet spark plugs, turn ignition switch to<br>OFF and crank engine several times. Install clean dry spark plugs. Start engine<br>following usual starting procedure. |
|                 | 6. Check fuel lines.                                                                                                                                                                                                                                         |
|                 | a. No fuel to the engine (spark plugs dry when removed).<br>Check fuel tank level; turn fuel valve on if applicable; check fuel filter, replace if<br>clogged; check condition of fuel and impulse lines and their connections.                              |
|                 | 7. Check engine compression.                                                                                                                                                                                                                                 |
|                 | a. Insufficient engine compression.<br>Replace defective part(s) (ex.: piston(s), ring(s), etc.).                                                                                                                                                            |

#### Section 03 TROUBLESHOOTING Subsection 02 (ENGINE)

| SYMPTOM         | IRREGULAR ENGINE IDLE.                                                                              |
|-----------------|-----------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE AFTER ENGINE WARM UP.                                                                    |
| Test/Inspection | 1. Check primer.                                                                                    |
|                 | a. Fuel leaks at primer nipple which is mounted to carburetor. <i>Replace.</i>                      |
|                 | 2. Check choke.                                                                                     |
|                 | a. Choke plunger may be partially opened. <i>Readjust.</i>                                          |
|                 | 3. Check carburetor adapter.                                                                        |
|                 | a. Air enters through a crack. <i>Replace.</i>                                                      |
|                 | 4. Check air screw position.                                                                        |
|                 | a. Inadequate fuel/air mixture.<br>Adjust according to specifications (refer to TECHNICAL DATA 10). |
|                 | 5. Check ignition system trigger coil air gap.                                                      |
|                 | a. Air gap is too large.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).        |
|                 | 6. Check dimension of pilot jet.                                                                    |
|                 | a. Inadequate fuel/air mixture.<br>Adjust according to specifications (refer to TECHNICAL DATA 10). |
|                 | 7. Check reed valve.                                                                                |
|                 | a. Improper tightness and/or opening.<br>Replace or adjust. Refer to proper engine subsection.      |
|                 | 8. Perform engine leak test.                                                                        |
|                 | a. Leaking gaskets allow air to enter in engine.<br>Replace defective parts.                        |

Subsection 02 (ENGINE)

| SYMPTOM         | HIGH ENGINE OPERATING TEMPERATURE.                                                                                                                                           |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                  |
| Test/Inspection | 1. Check temperature gauge sensor.                                                                                                                                           |
|                 | a. False reading.<br>Check terminal connections. If problem still persists, replace sensor.                                                                                  |
|                 | 2. Check fan belt.                                                                                                                                                           |
|                 | a. Belt slides because it is too loose.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                                  |
|                 | 3. Verify antifreeze level and check if there is air infiltration in the system or if there are leaks in gasket areas.                                                       |
|                 | <ul> <li>a. Low antifreeze level or air in system.</li> <li>Add antifreeze until recommended level is reached, bleed system and/or tighten<br/>clamps at fitting.</li> </ul> |
|                 | 4. Check if antifreeze flows through system properly.                                                                                                                        |
|                 | a. Foreign particles and/or broken coolant pump impeller.<br>Clean cooling system and/or replace coolant pump impeller.                                                      |
|                 | 5. Check thermostat.                                                                                                                                                         |
|                 | a. Thermostat reacts slowly or not at all. <i>Replace.</i>                                                                                                                   |
|                 | 6. Check antifreeze concentration.                                                                                                                                           |
|                 | a. Antifreeze concentration is too high.<br>Adjust concentration according to Bombardier's recommendations.                                                                  |
|                 | 7. Check tank cap.                                                                                                                                                           |
|                 | a. Cap does not hold pressure.<br><i>Replace.</i>                                                                                                                            |
|                 | 8. Check carburetion.                                                                                                                                                        |
|                 | a. Improperly adjusted or inadequate carburetor components.<br>Adjust according to specifications (refer to TECHNICAL DATA 10) or replace<br>inadequate component(s).        |
|                 | 9. Check cylinder head gaskets.                                                                                                                                              |
|                 | a. Worn gaskets.<br><i>Replace.</i>                                                                                                                                          |
|                 | 10. Check ignition timing.                                                                                                                                                   |
|                 | a. Ignition timing is too advanced.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                                      |
|                 | 11. Check if there are leaks at air intake silencer and/or engine crankcase.                                                                                                 |
|                 | a. Leak(s).<br>Repair or replace.                                                                                                                                            |
|                 | 12. Check condition and heat range of spark plugs.                                                                                                                           |
|                 | a. Melted spark plug tip or inadequate heat range. <i>Replace.</i>                                                                                                           |

#### Section 03 TROUBLESHOOTING Subsection 02 (ENGINE)

| SYMPTOM         | ENGINE EQUIPPED WITH RAVE VALVE DOES NOT REACH ITS FULL<br>OPERATING RPM (500 TO 1000 RPM SLOWER).                                                       |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                              |
| Test/Inspection | <ol> <li>Check RAVE valve pistons.</li> <li>a. Valve piston(s) is (are) too far out.<br/>Screw valve piston(s) to bottom.</li> </ol>                     |
|                 | <ul> <li>2. Check RAVE valve stems.</li> <li>a. Bent RAVE valve stem(s).</li> <li><i>Replace.</i></li> </ul>                                             |
|                 | <ul> <li>3. Check RAVE valves.</li> <li>a. Jammed valve(s).</li> <li>Clean.</li> </ul>                                                                   |
|                 | <ul> <li>4. Check tension of RAVE springs.         <ul> <li>a. Inadequate spring tension.</li> <li><i>Replace.</i></li> </ul> </li> </ul>                |
|                 | 5. Check RAVE pressure holes.<br>a. Clogged holes.<br><i>Clean.</i>                                                                                      |
|                 | <ul> <li>6. Check clamps or sleeves.</li> <li>a. Damaged clamp(s) or sleeve(s).<br/>Replace.</li> </ul>                                                  |
|                 | <ul> <li>7. Check exhaust tightness.</li> <li>a. Exhaust system is leaking leading to a too low back pressure.<br/>Replaces parts and reseal.</li> </ul> |

| SYMPTOM         | ENGINE EQUIPPED WITH RAVE. ENGINE HESITATES AT MID-SPEED AND<br>REACHES MAXIMUM PERFORMANCE ONLY AFTER A WHILE.         |
|-----------------|-------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                             |
| Test/Inspection | 1. Check RAVE valve spring(s).                                                                                          |
|                 | a. Spring tension is too weak or spring(s) is (are) broken. <i>Replace.</i>                                             |
|                 | 2. Check RAVE valve cover red adjustment screws.                                                                        |
|                 | a. Adjustment screw(s) is (are) too loose.<br>Adjust according to ASSEMBLY PROCEDURE in appropriate engine subsections. |
|                 | 3. Check RAVE valve movement (RAVE movement indicator P/N 861 7258 00).                                                 |
|                 | a. Valve(s) is (are) stuck in open position.<br><i>Clean.</i>                                                           |

| SYMPTOM         | REWIND STARTER ROPE DOES NOT REWIND. |
|-----------------|--------------------------------------|
| CONDITION       | NORMAL USE.                          |
| Test/Inspection | 1. Check rewind spring.              |
|                 | a. Broken spring.<br>Replace spring. |

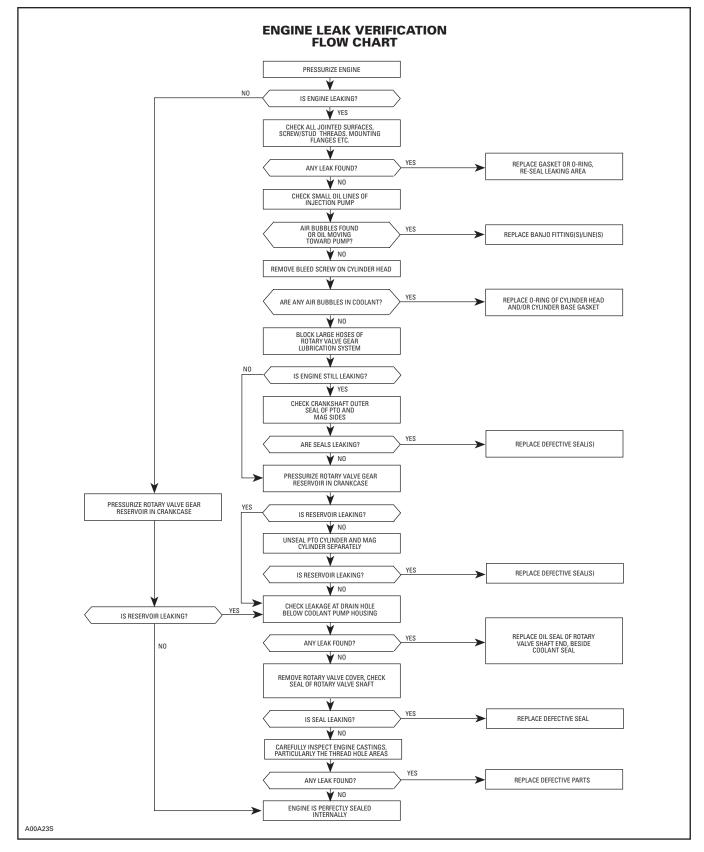

Subsection 02 (ENGINE)

| SYMPTOM         | REWIND STARTER PAWL DOES NOT ENGAGE.                                         |
|-----------------|------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                  |
| Test/Inspection | 1. Check stopper spring.                                                     |
|                 | a. Broken stopper spring.<br><i>Replace.</i>                                 |
|                 | 2. Check pawl and pawl lock.                                                 |
|                 | a. Pawl and pawl lock have stuck together because of heat. <i>Replace.</i>   |
|                 | 3. Check pawl and rope sheave.                                               |
|                 | a. Pawl and rope sheave have stuck together because of heat. <i>Replace.</i> |

| SYMPTOM         | ENGINE PINGING.                                                                                                                                       |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                           |
| Test/Inspection | 1. Check fuel lines.                                                                                                                                  |
|                 | a. Bent fuel lines (preventing fuel from flowing through). <i>Relocate or replace fuel lines.</i>                                                     |
|                 | 2. Check if carburetor(s) is (are) clean.                                                                                                             |
|                 | a. Dirt prevents fuel from flowing through. <i>Clean.</i>                                                                                             |
|                 | 3. Check ignition timing.                                                                                                                             |
|                 | a. Timing is too advanced.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                        |
|                 | 4. Check compression ratio.                                                                                                                           |
|                 | a. Compression ratio is too high.<br>Replace inadequate part(s) to obtain manufacturer's recommended compression<br>ratio or use a higher grade fuel. |

| SYMPTOM         | ENGINE GENERATES A LOT OF VIBRATIONS.                                                                                                                                                    |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                              |
| Test/Inspection | 1. Check engine supports and stopper.                                                                                                                                                    |
|                 | a. Loose and/or broken supports or interference between support(s) and chassis.<br>Retighten to specification (refer to TECHNICAL DATA 10) or replace.                                   |
|                 | 2. Check drive pulley (refer to: vibrations coming from drive pulley).                                                                                                                   |
|                 | 3. Check carburetor synchronization.                                                                                                                                                     |
|                 | <ul> <li>a. Throttle slide heights are adjusted differently and/or throttle slide openings are<br/>unsynchronized.</li> <li>Adjust throttle slide heights and throttle cable.</li> </ul> |

# ENGINE LEAK VERIFICATION FLOW CHART

# **FUEL AND OIL SYSTEMS**

The following chart is provided to help in diagnosing the probable source of troubles. It should be used as a guideline. Some causes or corrections may not apply to a specific model.

| SYMPTOM         | HIGH FUEL CONSUMPTION OR RICH MIXTURE.                                                                                                                                                |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                           |
| Test/Inspection | <ul> <li>1. Check fuel tank.</li> <li>a. Perforated fuel tank.</li> <li><i>Replace fuel tank.</i></li> </ul>                                                                          |
|                 | <ul> <li>2. Check fuel pump reservoir and carburetor fittings.</li> <li>a. Leaking fittings.<br/>Replace defective part.</li> </ul>                                                   |
|                 | <ul> <li>3. Check primer.</li> <li>a. Fuel flows through primer while engine runs.<br/>Replace primer.</li> </ul>                                                                     |
|                 | <ul> <li>4. Check float height in carburetor(s).</li> <li>a. Fuel level is too high in float bowl(s).<br/>Adjust according to specifications (refer to TECHNICAL DATA 10).</li> </ul> |
|                 | 5. Check needle valve.                                                                                                                                                                |
|                 | a. Foreign particles prevent needle valve(s) from closing and/or worn seating area.<br>Clean or replace needle valve(s), then clean seating area.                                     |

| SYMPTOM         | FUEL LEAKS IN ENGINE BASE WHEN ENGINE IS STOPPED.   |
|-----------------|-----------------------------------------------------|
| CONDITION       | NORMAL USE.                                         |
| Test/Inspection | 1. Check items 3, 4 and 5 of HIGH FUEL CONSUMPTION. |
|                 | 2. Check fuel pump diaphragm.                       |
|                 | a. Cracked diaphragm.<br><i>Replace.</i>            |

Subsection 03 (FUEL AND OIL SYSTEMS)

| SYMPTOM         | ENGINE LACKS POWER OR STALLS AT HIGH RPM.                   |
|-----------------|-------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                 |
| Test/Inspection | 1. Check fuel tank vent hose.<br>a. Kinked or clogged hose. |
|                 | Relocate or replace.                                        |
|                 | 2. Check fuel filter.                                       |
|                 | a. Clogged filter.<br><i>Replace.</i>                       |
|                 | 3. Check fuel lines.                                        |
|                 | a. Kinked or clogged lines.<br><i>Relocate or replace.</i>  |
|                 | 4. Check fuel pump flow.                                    |
|                 | a. Dried diaphragm.<br><i>Replace.</i>                      |
|                 | 5. Check if carburetor(s) is (are) clean.                   |
|                 | a. Varnish.<br><i>Clean.</i>                                |

| SYMPTOM         | HIGH INJECTION OIL CONSUMPTION.                                                                     |
|-----------------|-----------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                         |
| Test/Inspection | 1. Check oil injection pump adjustment.                                                             |
|                 | a. Oil injection pump adjusted too rich. <i>Adjust.</i>                                             |
|                 | 2. Check injection pump identification.                                                             |
|                 | a. Wrong pump installed.<br>Replace with the appropriate pump. Refer to OIL INJECTION SYSTEM 04-05. |
|                 | 3. Check injection oil lines and their fitting.                                                     |
|                 | a. Leaking lines and/or cover.<br>Replace defective part(s).                                        |
|                 | 4. Check injection pump cover gasket.                                                               |
|                 | a. Worn gasket.<br><i>Replace.</i>                                                                  |
|                 | 5. Pressurize crankcase rotary valve gear reservoir.                                                |
|                 | a. Leaking gasket(s).<br>Replace gasket(s).                                                         |

Subsection 03 (FUEL AND OIL SYSTEMS)

| SYMPTOM         | ENGINE RUNS OUT OF FUEL (OR LEAN MIXTURE).                                                                                      |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                     |
| Test/Inspection | 1. Check if lines are perforated or kinked and make sure they do not leak at fittings.                                          |
|                 | a. Lines are too big for their fittings or are improperly routed. <i>Replace or properly relocate lines.</i>                    |
|                 | 2. Check fuel pump outlet flow.                                                                                                 |
|                 | a. Dirt clogging fuel pump lines or torn membrane. <i>Clean or replace fuel pump.</i>                                           |
|                 | 3. Check carburetor needle valve(s).                                                                                            |
|                 | a. Dirt (varnish, foreign particle) clogging fuel line inlets. <i>Clean.</i>                                                    |
|                 | 4. Check main jet.                                                                                                              |
|                 | a. Dirt (varnish, foreign particle) accumulation at main jet. <i>Clean.</i>                                                     |
|                 | 5. Check float height in carburetor bowl(s).                                                                                    |
|                 | a. Running out of fuel at high speed because float height is too low.<br>Adjust float lever height according to specifications. |

# **TRANSMISSION AND BRAKE SYSTEMS**

The following charts are provided to help in diagnosing the probable source of troubles. It should be used as a guideline. Some causes or corrections may not apply to a specific model.

# TRANSMISSION

| SYMPTOM         | THE SNOWMOBILE ACCELERATES SLOWLY, ESPECIALLY WHEN IT IS STOPPED.                                                                                                                                                                                                                 |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                                                                                                                       |
| Test/Inspection | 1. Check drive belt condition.                                                                                                                                                                                                                                                    |
|                 | a. Belt is too narrow (drive belt engagement is higher in drive pulley).<br>Replace belt if width is 3 mm (1/8") less than a new one<br>(refer to TECHNICAL DATA 10).                                                                                                             |
|                 | 2. Check distance between pulleys and/or drive belt deflection.                                                                                                                                                                                                                   |
|                 | <ul> <li>a. Distance is too small between pulleys or deflection is too high<br/>(drive belt engagement is higher in drive pulley).</li> <li>Adjust distance between pulleys and/or drive belt deflection according to<br/>specifications (refer to TECHNICAL DATA 10).</li> </ul> |
|                 | 3. Check driven pulley sliding half play.                                                                                                                                                                                                                                         |
|                 | a. Jammed sliding half.<br><i>Replace.</i>                                                                                                                                                                                                                                        |
|                 | 4. Check spring tension of driven pulley sliding half.                                                                                                                                                                                                                            |
|                 | a. Sliding half rotation is accelerated when spring tension is too weak.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).                                                                                                                                      |
|                 | 5. Refer to VIBRATIONS ORIGINATING FROM DRIVEN PULLEY and check items listed.                                                                                                                                                                                                     |
|                 | 6. Check drive pulley spring tension.                                                                                                                                                                                                                                             |
|                 | a. Spring tension is too weak. <i>Replace.</i>                                                                                                                                                                                                                                    |

| SYMPTOM         | ENGINE MAXIMUM RPM IS TOO HIGH AND TOP SPEED IS NOT REACHED.                                          |
|-----------------|-------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                           |
| Test/Inspection | 1. Check items 1, 2 and 3 of THE SNOWMOBILE ACCELERATES SLOWLY,<br>ESPECIALLY WHEN IT IS STOPPED.     |
|                 | 2. Check driven pulley spring tension.                                                                |
|                 | a. Spring tension is too stiff.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).   |
|                 | 3. Check position of the calibration screws. (TRA drive pulley)                                       |
|                 | a. Selected numbers are too high.<br>Adjust according to specifications (refer to TECHNICAL DATA 10). |
|                 | 4. Refer to VIBRATIONS ORIGINATING FROM DRIVEN PULLEY and check items<br>listed.                      |

Subsection 04 (TRANSMISSION AND BRAKE SYSTEMS)

| SYMPTOM         | LOOSENESS IS FELT IN DRIVE SYSTEM WHEN ACCELERATING/DECELERATING.                                                                                            |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                  |
| Test/Inspection | <ul> <li><b>1. Check drive chain tension.</b></li> <li>a. Drive chain is too loose.<br/><i>Adjust.</i></li> </ul>                                            |
|                 | <ul> <li>2. Check play of driven pulley splines.</li> <li>a. Worn splines.<br/>Replace.</li> </ul>                                                           |
| SYMPTOM         | VIBRATIONS ORIGINATING FROM DRIVE PULLEY.                                                                                                                    |
| CONDITION       | NORMAL USE.                                                                                                                                                  |
| Test/Inspection | <ul> <li>1. Check drive belt.</li> <li>a. Belt width is uneven at many places.</li> <li>Replace (refer to TECHNICAL DATA 10 for the part number).</li> </ul> |
|                 | <ul> <li>2. Check tightening torque of drive pulley screw.</li> <li>a. Moving governor cup.<br/>Retighten screw.</li> </ul>                                  |
|                 | <ul> <li><b>3. Spring cover screws.</b></li> <li>a. Spring cover moves and restrains sliding half movement.<br/><i>Retighten screws.</i></li> </ul>          |

| <ol><li>Check spring cover (TRA TYPE) and/or outer half bushings.</li></ol>           |  |
|---------------------------------------------------------------------------------------|--|
| a. Excessive gap between bushings and inner half shaft, thus restraining sliding half |  |
| movements.                                                                            |  |
| Replace bushing(s).                                                                   |  |
|                                                                                       |  |

#### 5. Check sliding half slider shoes.

a. Worn slider shoes. *Replace.* 

| SYMPTOM         | VIBRATIONS ORIGINATING FROM DRIVEN PULLEY.                                                                                      |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                     |
| Test/Inspection | <ol> <li>Check sliding half play.</li> <li>a. Sliding half runout.<br/>Replace sliding half bushing.</li> </ol>                 |
|                 | <ul> <li>2. Check sliding half and fixed half straightness.</li> <li>a. Sliding half/fixed half runout.<br/>Replace.</li> </ul> |
|                 | <ul> <li>3. Check cam slider shoes.</li> <li>a. One or two slider shoes out of three are broken.<br/><i>Replace.</i></li> </ul> |

| SYMPTOM         | PULLEYS DO NOT DOWN SHIFT PROPERLY.                                                                |
|-----------------|----------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                        |
| Test/Inspection | 1. Check driven pulley spring tension.                                                             |
|                 | a. Spring tension is too weak.<br>Adjust according to specifications (refer to TECHNICAL DATA 10). |
|                 | 2. Refer to VIBRATIONS COMING FROM DRIVEN PULLEY and check items listed.                           |
|                 | 3. Check drive pulley bushings (cleanliness, wear, etc.).                                          |
|                 | a. Bushings stick to fixed half pulley shaft. <i>Clean or replace.</i>                             |
|                 | 4. Check driven pulley spring tension.                                                             |
|                 | a. Spring tension is too weak. <i>Replace.</i>                                                     |

| SYMPTOM         | IT IS DIFFICULT TO ENGAGE TRANSMISSION IN FORWARD OR REVERSE GEAR.                        |
|-----------------|-------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                               |
| Test/Inspection | 1. Check position of gear shift lever adjustment screw.                                   |
|                 | a. Improper adjustment.<br>Adjust according to specifications (refer to TRANSMISSION 05). |

| SYMPTOM         | UNEVEN BELT WEAR ON ONE SIDE ONLY.                                                                                                                  |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                         |
| Test/Inspection | <ol> <li>Check tightening torque of engine mount bolts.</li> <li>a. Loose engine mount.<br/>Tighten engine mount nuts/bolts equally.</li> </ol>     |
|                 | <ul> <li>2. Check pulley alignment.</li> <li>a. Pulley misalignment.</li> <li><i>Align pulleys.</i></li> </ul>                                      |
|                 | <ul> <li>3. Check drive belt contact area on pulleys.</li> <li>a. Rough or scratched pulley surfaces.<br/>Repair or replace pulley half.</li> </ul> |
|                 | <ul> <li>4. Check driven pulley sliding half play.</li> <li>a. Driven pulley bushing worn.<br/><i>Replace bushing.</i></li> </ul>                   |

| SYMPTOM         | BELT GLAZED EXCESSIVELY OR HAVING BAKED APPEARANCE.                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                      |
| Test/Inspection | 1. Check if drive pulley bushings are worn.                                                                                                                      |
|                 | a. Insufficient pressure on belt sides.<br><i>Replace bushing.</i>                                                                                               |
|                 | <ul> <li>2. Check condition of drive pulley fixed half shaft.</li> <li>a. Rusted drive or driven pulley shafts.<br/>Clean shaft with fine steel wool.</li> </ul> |
|                 | <ul> <li>3. Check if pulley halves are clean.</li> <li>a. Oil on pulley surfaces.<br/>Clean pulley halves.</li> </ul>                                            |
|                 | <ul> <li>4. Check pulley calibration.</li> <li>a. Improper pulley calibration.</li> <li><i>Calibrate according to specifications.</i></li> </ul>                 |

| SYMPTOM                                   | BELT WORN EXCESSIVELY IN TOP WIDTH.                                                                                          |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| CONDITION                                 | NORMAL USE.                                                                                                                  |
| Test/Inspection                           | 1. Check drive pulley.                                                                                                       |
| Considerable<br>use                       | a. Excessive slippage due to irregular outward actuation movement of drive pulley. <i>Carry out drive pulley inspection.</i> |
| STATE STATE                               | 2. Check drive belt identification number.                                                                                   |
| AUGOCOCOCOCOCOCOCOCOCOCOCOCOCOCOCOCOCOCOC | a. Improper belt angle. (wrong type of belt).<br>Replace belt with an appropriate drive belt.                                |
| ATTOGER HIPO. 160.0.5.C                   | 3. Check drive belt width.                                                                                                   |
| New belt                                  | a. Considerable use.<br>Replace belt if 3 mm (1/8") less than recommended width (see TECHNICAL DATA 10).                     |

| SYMPTOM         | BELT WORN NARROW IN ONE SECTION.                                                                                                                                      |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                           |
| Test/Inspection | <ol> <li>Check if parking brake is released.</li> <li>a. Parking brake is engaged.</li> <li><i>Release parking brake.</i></li> </ol>                                  |
|                 | <ul> <li>2. Check track tension/alignment.</li> <li>a. Frozen or too tight track.</li> <li>Liberate track from ice or check track tension and alignment.</li> </ul>   |
|                 | <ul> <li>3. Check drive pulley.</li> <li>a. Drive pulley not functioning properly.<br/>Repair or replace drive pulley.</li> </ul>                                     |
|                 | <ul> <li>4. Check idle speed.</li> <li>a. Engine idle speed too high.<br/>Adjust according to specifications.</li> </ul>                                              |
|                 | <ul> <li>5. Check drive belt length.</li> <li>a. Incorrect belt length.</li> <li>Replace belt with an appropriate drive belt (refer to TECHNICAL DATA 10).</li> </ul> |

| Test/Inspection | <ol> <li>Check brake pad thickness.</li> <li>a. Pads are worn up to wear warner.<br/>Replace.</li> </ol> |

# **ELECTRICAL SYSTEM**

The following chart is provided to help in diagnosing the probable source of troubles. It should be used as a guideline. Some causes or corrections may not apply to a specific model.

| SYMPTOM         | STARTER DOES NOT TURN.                                                                                                                                               |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                          |
| Test/Inspection | <ul> <li>1. Check fuse.         <ul> <li>a. Burnt fuse.</li> <li>Check wiring condition and replace fuse.</li> </ul> </li> </ul>                                     |
|                 | <ul> <li>2. Check continuity of starter switch contact points.</li> <li>a. Poor contact of starter switch contact points.<br/>Repair or replace switch.</li> </ul>   |
|                 | <ul> <li>3. Check continuity between starter switch and solenoid.</li> <li>a. Open circuit between starter switch and solenoid switch.<br/><i>Repair.</i></li> </ul> |

| SYMPTOM         | STARTER TURNS; BUT DOES NOT CRANK THE ENGINE.                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                           |
| Test/Inspection | <ol> <li>Check battery capacity.</li> <li>a. Shorted battery cell(s).<br/>Replace.</li> </ol>                                                                         |
|                 | <ul> <li>2. Check battery charge.</li> <li>a. Weak battery.</li> <li>Recharge battery and verify recharge system and wires.</li> </ul>                                |
|                 | <ul> <li>3. Check wire connection.</li> <li>a. Inadequate connection (too much resistance).</li> <li>Clean and reconnect.</li> </ul>                                  |
|                 | <ul> <li>4. Check solenoid switch contact disc.</li> <li>a. Burnt or poor contact of solenoid switch contact disc.<br/>Replace solenoid switch.</li> </ul>            |
|                 | <ul> <li>5. Check continuity of solenoid switch pull-in winding.</li> <li>a. Open circuit of solenoid switch pull-in winding.<br/>Replace solenoid switch.</li> </ul> |
|                 | 6. Check brushes.                                                                                                                                                     |
|                 | a. Poor contact of brushes.<br><i>Replace brushes.</i>                                                                                                                |
|                 | 7. Check commutator.                                                                                                                                                  |
|                 | a. Burnt commutator.<br>Turn commutator on a lathe. Respect outer diameter wear limit.<br>Refer to ELECTRIC STARTER 06-05.                                            |

| <ul> <li>8. Check height of commutator mica.</li> <li>a. Commutator mica too high.<br/>Undercut mica.</li> </ul>                  |
|-----------------------------------------------------------------------------------------------------------------------------------|
| 9. Check field coil resistance.<br>a. Shorted field coil.<br><i>Repair or replace yoke.</i>                                       |
| <b>10. Check armature resistance.</b> a. Shorted armature. <i>Repair or replace armature.</i>                                     |
| <ul> <li><b>11. Check tension of brush springs.</b></li> <li>a. Weak brush spring tension.<br/><i>Replace springs.</i></li> </ul> |
| <b>12. Check yoke assembly magnets.</b> a. Weak magnets. <i>Replace yoke assembly.</i>                                            |
| <ul> <li>13. Check if bushings are worn.</li> <li>a. Worn bushings.</li> <li><i>Replace bushings.</i></li> </ul>                  |

| SYMPTOM         | STARTER TURNS, BUT OVERRUNNING CLUTCH PINION DOES NOT MESH WITH RING GEAR.                                                         |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                        |
| Test/Inspection | <ol> <li>Check clutch pinion gear.</li> <li>a. Worn clutch pinion gear.<br/>Replace clutch.</li> </ol>                             |
|                 | 2. Check clutch.<br>a. Defective clutch.<br><i>Replace clutch.</i>                                                                 |
|                 | <ul> <li>3. Check movement of clutch on splines.</li> <li>a. Poor movement of clutch on splines.<br/>Clean and correct.</li> </ul> |
|                 | <ul> <li>4. Check clutch bushing.</li> <li>a. Worn clutch bushing.</li> <li><i>Replace clutch</i>.</li> </ul>                      |
|                 | <ul> <li>5. Check starter bushings.</li> <li>a. Worn starter bushing(s).</li> <li>Replace bushing(s).</li> </ul>                   |
|                 | 6. Check ring gear.<br>a. Worn ring gear.<br>Replace ring gear.                                                                    |

| SYMPTOM         | ELECTRIC STARTER KEEPS TURNING WHEN ENGINE IS STARTED.                                                                    |
|-----------------|---------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                               |
| Test/Inspection | 1. Check clutch.                                                                                                          |

|                 | a. Starter switch returns poorly.<br>Replace ignition switch.                                                             |

| SYMPTOM         | NOISE OCCURENCE WHEN STARTING ENGINE.                                                                                  |
|-----------------|------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                            |
| Test/Inspection | 1. Check if ring gear is well-mounted to drive pulley inner half.                                                      |
|                 | a. Loose and/or broken bolts.<br>Retighten bolts using thread locker or replace ring gear and drive pulley inner half. |

| SYMPTOM         | REGULATOR BLACK WIRE IS MELTED (HARNESS SIDE).                         |
|-----------------|------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                            |
| Test/Inspection | 1. Check that big ground wire at battery is well connected to chassis. |
|                 | a. Corroded and/or loose connection(s). <i>Clean and/or retighten.</i> |

| SYMPTOM         | OPTIONAL ELECTRIC STARTER DOES NOT WORK WHEN TURNING IGNITION SWITCH.                                                           |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                     |
| Test/Inspection | <ol> <li>Check connection of BLACK wire (solenoid ground) in 3-wire housing coming<br/>from magneto (white housing).</li> </ol> |
|                 | a. Corroded and/or loose connection(s).<br><i>Clean and/or retighten.</i>                                                       |

| SYMPTOM         | ELECTRIC STARTER SOMETIMES DOES NOT WORK WHEN TURNING IGNITION SWITCH.       |
|-----------------|------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                  |
| Test/Inspection | 1. Check battery cables and starter wires.                                   |
|                 | a. Corroded and/or loose connection(s).<br><i>Clean and/or retighten.</i>    |
|                 | 2. Check fuse.                                                               |
|                 | a. Oxidized or burnt fuse.<br><i>Clean or replace.</i>                       |
|                 | 3. Check wiring harness connections.                                         |
|                 | a. Oxidized connections.<br>Clean or replace defective terminals.            |
|                 | 4. Check ignition switch.                                                    |
|                 | a. Defective contacts in ignition switch. <i>Replace.</i>                    |
|                 | 5. Check solenoid of electric starter.                                       |
|                 | a. Shorted solenoid wiring harness or eroded contact washer. <i>Replace.</i> |

| SYMPTOM         | ENGINE DOES NOT START — NO SPARK AT SPARK PLUG.                                                                                                                                                                                                                                                                      |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | AT ENGINE CRANKING.                                                                                                                                                                                                                                                                                                  |
| Test/Inspection | 1. Verify spark plug condition.                                                                                                                                                                                                                                                                                      |
|                 | a. Defective, improperly set, worn-out, fouled.<br>Identify source of problem and correct. Replace spark plugs.                                                                                                                                                                                                      |
|                 | 2. Verify spark plug cap resistance with an ohmmeter.                                                                                                                                                                                                                                                                |
|                 | a. Defective part.<br><i>Replace cap.</i>                                                                                                                                                                                                                                                                            |
|                 | 3. Verify if problem originated from electrical system wiring harness and/or accessories and/or ignition cut-out switches by unplugging the 3-wire connectors between the magneto/generator and the vehicle wiring harness. Check condition of connectors.                                                           |
|                 | <ul> <li>Heating, rotating or sharp part in contact with harness. Improper harness routing.<br/>Defective switch(es). Corroded connector terminals.<br/>Replace or repair damaged wires. Reroute where necessary. Replace defective<br/>switch(es). Clean terminals and apply silicone dielectric grease.</li> </ul> |
|                 | 4. Verify trigger coil resistance with an ohmmeter and connector condition.                                                                                                                                                                                                                                          |
|                 | a. Defective coil. Corroded connector terminals.<br>Replace defective coil. Clean terminals and apply silicone dielectric grease.                                                                                                                                                                                    |
|                 | 5. Verify condition of ignition coil.                                                                                                                                                                                                                                                                                |
|                 | a. Mechanically damaged part. Vibration problem. Electrically damaged part. <i>Tighten mounting screws. Replace ignition coil.</i>                                                                                                                                                                                   |
|                 | 6. Verify condition of ignition generator coils.                                                                                                                                                                                                                                                                     |
|                 | a. Mechanically damaged part. Vibration problem. Electrically damaged part. <i>Tighten mounting screws. Replace coils.</i>                                                                                                                                                                                           |
|                 | 7. Verify MPEM.                                                                                                                                                                                                                                                                                                      |
|                 | a. Mechanically damaged part. Vibration problem. Electrically damaged part.<br><i>Tighten mounting screws. Replace MPEM, retest and verify ignition timing.</i>                                                                                                                                                      |

| SYMPTOM         | CDI MODULE DOES NOT WORK.                                                                                                                      |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                    |
| Test/Inspection | <ol> <li>Check that high tension coil wires do not touch any metal parts.</li> <li>a. Short circuit.<br/>Isolate and reroute wires.</li> </ol> |

|                 | a. Faulty installation of optional equipment.<br>Find optional wires connected directly to DC ground (BK wire to chassis) or to any DC<br>hot wire (RD, RD/BL). Disconnect and reconnect to AC current (YL and YL/BK wires). |
|                 | <ul> <li>2. Verify sender unit for free movement and/or correct arm position.</li> <li>a. Defective or damaged part.<br/>Correct or replace sender unit.</li> </ul>                                                          |
|                 | 3. Verify sender unit/gauge wiring harness condition.                                                                                                                                                                        |
|                 | a. Heating, rotating or sharp part in contact with harness. Improper harness routing. <i>Replace or repair damaged wires. Reroute where necessary.</i>                                                                       |

| SYMPTOM         | WITH ENGINE IDLING NO ELECTRICAL ACCESSORIES WORK.                                                                   |
|-----------------|----------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                          |
| Test/Inspection | <ul> <li>1. Check idle speed.</li> <li>a. Too low idle speed.</li> <li><i>Readjust to specifications.</i></li> </ul> |
|                 | 2. Verify regulator.<br>a. Faulty regulator.<br><i>Replace.</i>                                                      |

| SYMPTOM         | BRAKE LIGHT REMAINS ON.                                                                            |
|-----------------|----------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                        |
| Test/Inspection | 1. Check if bulb is properly installed.                                                            |
|                 | a. Bulb is not installed correctly (contact elements are reversed). <i>Install bulb correctly.</i> |
|                 | 2. Check brake switch.                                                                             |
|                 | a. Switch contact remains closed.<br><i>Replace brake switch.</i>                                  |

| SYMPTOM         | REAR LIGHT BULB FLASHES.                                                                    |
|-----------------|---------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                 |
| Test/Inspection | 1. Check bulb tightness in housing.                                                         |
|                 | a. Looseness at bulb contact elements.<br>Install bulb correctly.                           |
|                 | 2. Check if rear light is properly connected.                                               |
|                 | a. Connector housing is partially connected.<br>Install connector housing properly.         |
|                 | 3. Check continuity of wires.                                                               |
|                 | a. Corroded terminals and/or broken wires.<br>Replace terminal(s) or crimp defective wires. |

| SYMPTOM         | TACHOMETER DOES NOT WORK.                                                                      |
|-----------------|------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                    |
| Test/Inspection | 1. Check continuity of wires.                                                                  |
|                 | a. Corroded terminals and/or broken wires.<br>Replace terminal(s) or crimp defective wires.    |
|                 | 2. Check tachometer part number.                                                               |
|                 | a. Models with 360 W magneto have a different tachometer. <i>Replace with appropriate one.</i> |

| SYMPTOM         | HIGH BEAM PILOT LAMP LIGHTS UP WHEN LOW BEAM IS SELECTED.                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                                                                   |
| Test/Inspection | 1. Check proper connections.                                                                                                                                                                                                  |
|                 | a. YELLOW wire connected to pilot lamp. Mixed-up connections with heating<br>element pilot lamps.<br><i>Reconnect a YELLOW/BLACK wire to pilot lamp. YELLOW wires are connected to</i><br><i>heating element pilot lamps.</i> |

# **SUSPENSION AND TRACK**

The following chart is provided to help in diagnosing the probable source of troubles. It should be used as a guideline. Some causes or corrections may not apply to a specific model.

| SYMPTOM         | REAR SUSPENSION BOTTOMS OUT.                                                                                                                           |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                            |
| Test/Inspection | <ol> <li>Check rear spring preload or rear arm spring preload.</li> <li>a. Spring tension is too low.<br/>Increase rear arm spring preload.</li> </ol> |

| SYMPTOM         | SLIDER SHOES WEAR OUT PREMATURELY.                                                                                                        |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                               |
| Test/Inspection | 1. Check track tension.                                                                                                                   |
|                 | a. Pressure is too great on slider shoes.<br>Adjust according to specifications (refer to TECHNICAL DATA 10).<br>Replace defective parts. |

| SYMPTOM         | TRACK CLEATS BECOME BLUE.                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                                                                                                                   |
| Test/Inspection | <ul> <li>1. Check track tension.</li> <li>a. Pressure is too great on cleats.</li> <li>Adjust according to an adjustication (refer to TECUNICAL DATA 10)</li> </ul>                                                                                                           |
|                 | <ul> <li>Adjust according to specifications (refer to TECHNICAL DATA 10).</li> <li>2. Check slider shoes and/or suspension retaining screws.</li> <li>a. Worn slider shoes or lost retaining screws.</li> <li>Replace defective parts and/or tighten loose screws.</li> </ul> |

Subsection 06 (SUSPENSION AND TRACK)

| SYMPTOM         | NOISE OR VIBRATIONS ORIGINATING FROM THE TRACK.                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                         |
| Test/Inspection | 1. Check slide suspension retaining bolts.                                                                                                                          |
| -               | <ul> <li>a. Missing bolt(s) allowing movement of certain components which in turn interfere<br/>with track rotation.<br/><i>Replace missing bolt(s).</i></li> </ul> |
|                 | 2. Check condition of idler wheel(s).                                                                                                                               |
|                 | a. Idler wheel rubber is damaged.<br><i>Replace.</i>                                                                                                                |
|                 | 3. Check guide cleats.                                                                                                                                              |
|                 | a. Top portion of guide cleat(s) is bent. <i>Replace.</i>                                                                                                           |
|                 | 4. Check sprockets.                                                                                                                                                 |
|                 | a. One or various teeth of drive shaft sprockets are broken. <i>Replace sprocket(s).</i>                                                                            |
|                 | 5. Check track rods and/or internal traction teeth.                                                                                                                 |
|                 | a. One or various track rods and/or teeth are broken. <i>Replace track.</i>                                                                                         |

| SYMPTOM         | DERAILING TRACK.                                                                                                         |
|-----------------|--------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                              |
| Test/Inspection | 1. Check track tension.<br>a. Track is too loose.<br><i>Adjust.</i>                                                      |
|                 | <ul> <li>2. Check if track and slider shoes are properly aligned.</li> <li>a. Improper alignment.<br/>Adjust.</li> </ul> |

| SYMPTOM         | REAR SUSPENSION IS LOW OR TOO STIFF.                                                                                                                                        |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                                 |
| Test/Inspection | <ul> <li>1. Check track tension.</li> <li>a. Track is too tight.<br/>Adjust.</li> </ul>                                                                                     |
|                 | <ul> <li>2. Check if axles are properly lubricated.</li> <li>a. Improper lubrication and/or contaminated grease (sticky oil sludge).<br/>Clean and/or lubricate.</li> </ul> |
|                 | <b>3. Check rear spring preload.</b><br>a. Insufficient preload.<br>Increase preload using adjustment cams.                                                                 |

Subsection 06 (SUSPENSION AND TRACK)

| SYMPTOM         | WHEN HANDLEBAR IS TURNED, SNOWMOBILE UNDERSTEERS.                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                             |
| Test/Inspection | <ol> <li>Check ski runner condition.</li> <li>a. Worn ski runners.<br/>Replace.</li> </ol>                                                              |
|                 | <ul> <li>2. Check tension of front spring adjustment cams.</li> <li>a. Insufficient ski pressure on the ground.<br/>Increase spring preload.</li> </ul> |
|                 | <ul> <li>3. Check if front arm stopper strap is too long.</li> <li>a. Insufficient ski pressure on the ground.<br/>Shorten stopper strap.</li> </ul>    |

| SYMPTOM         | HANDLEBAR IS DIFFICULT TO TURN.                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                             |
| Test/Inspection | 1. Check position of front spring adjustment cams.                                                      |
|                 | a. More pressure on the ground when cam increases spring preload. <i>Reduce front spring preload.</i>   |
|                 | 2. Check position of stopper strap.                                                                     |
|                 | a. More weight when stopper strap is short.<br>Lengthen front arm stopper strap.                        |
|                 | 3. Check position of front arm shock adjustment cam(s).                                                 |
|                 | a. When spring tension is weak, more weight is transferred to the skis. <i>Increase spring preload.</i> |
|                 | 4. Check condition of ball joints.                                                                      |
|                 | a. Corrosion restrains movement.<br>Lubricate or replace.                                               |
|                 | 5. Check swing arm camber (liquid cooled models).                                                       |
|                 | a. Too much ski leg inclination.<br>Adjust camber to specifications.                                    |

Subsection 06 (SUSPENSION AND TRACK)

| SYMPTOM         | THE SNOWMOBILE IS UNSTABLE<br>(IT MOVES FROM LEFT TO RIGHT AND VICE VERSA).                                                                                  |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CONDITION       | NORMAL USE.                                                                                                                                                  |
| Test/Inspection | <ol> <li>Check ski runner condition.</li> <li>a. Worn or bent ski runners.<br/>Replace ski runners.</li> </ol>                                               |
|                 | 2. Check ski alignment.<br>a. Improper ski alignment.<br>Align skis in order to obtain proper toe-out (opening)<br>(to adjust, refer to STEERING SYSTEM 08). |
|                 | <ul> <li>3. Check if bushings are too loose in steering system.</li> <li>a. Bushings are too loose.<br/>Replace.</li> </ul>                                  |
